

PRINCIPLES OF INTERACTION DESIGN

(Interactive Spaces and New Media)

M.Des Semester II, DA-IICT

Course Code : PC752

Course Overview:

Interaction Design can be understood as the design of interactions between users and their artefacts. While it is often thought of in terms of software products, interaction design is a broad field that includes elements such as motion, space, sound, image and more.

Thinking past the boundaries of mobile or desktop interactions, this course encourages students to look at the physical world and the possibilities of creating new immersive experiences and environments.

Introducing technologies such as gesture and voice controls, hologram projections, 360 video, augmented, virtual and mixed realities the course will challenge students to understand how designing for interactive spaces diverges from small-scale interactions of mobile or web design, to encompass constraints of scale, medium, environment, and whole body utilization.

The course has been structured as a mix of lectures, short exercises and a semester project that will enable students to engage with design issues involving interaction through practical application.

In the semester project, students will undertake the creation of an interactive space. They will work individually and at times in groups, to investigate this area in the context of interaction design. Each student will by the end of the semester be expected to frame his/her individual proposal and develop an innovative design prototype.

DAY 1 : Feb 17th Monday

Lecture Session: Introduction and Approaches to Interaction Design

- a. What is interaction design?
- b. Everyday examples
- c. History and interdependent areas of design
- d. User Centric Design
- e. Activity Centric Design
- f. System Design
- g. Genius Design

Discussion: Five Dimensions of Interaction design

- a. Words
- b. Visual Representations
- c. Space
- d. Time
- e. Behaviour (Appearance & Texture, Sound)

Reading:

- Chapter 1: What is interaction design? in Saffer, D. (2010). Designing for interaction: Creating innovative applications and devices (2nd ed.). Berkeley, CA: New Riders.
